

This week, I worked with Isabella to implement One Fits All into the Flask app. Isabella has already adjusted the backend to accommodate for a user input. I had fixed most of the errors, except for the fact that I had no checkpoints on my local folder. This would require running the training on my computer or trying to find a way to copy the checkpoint from Isabella's computer. This would not exactly work though, because of some naming conventions that will cause errors. We will continue to work together and try to get the OFA tab running for just testing and outputting MSE and MAE values.
