

This is the first weekly report for semester 2. For this week, we began getting back into things and discussing our next steps forward with the rest of the group. I mainly spent this week familiarizing myself with everything again after coming back from an almost 2-month break. I also researched and looked into the new Chronos Bolt models since it was the first time I had worked with them. From my research and understanding, they are mainly designed to maximize efficiency while minimizing loss of accuracy as much as possible. The base Chronos models, especially the larger ones, are likely to be more accurate at the cost of way more computing power and resources. They also take much longer to run and process. I will need to perform some further testing to prove their capabilities and efficiencies.
