This week I worked with Sage to continue working on designing our user interface. He was able to successfully load data from a CSV file and create visualizations of them after parsing through it. Afterwards, I mainly focused on trying to figure ways to be able to share our work externally so that everyone else could look at our work and also do testing of their own but without ruining what we had before. For now, we have discovered 3 potential ways. The first way is my suggestion which was we create one account that we share and use amongst us. The second solution is through "snapshots" which creates directs to a particular frozen point in time, typically for a data visualization graph. The third way is through sharing like html links to each other where it will create our specific user interface, but I think this method may not be able to keep certain elements in tact when sending it from one person to another. I need to spend more time with these methods and potentially looking into any other methods on sharing our work on Grafana externally so that we all can look and work on it individually as well.
