For this week I investigated the collaborative options for working on the project. I think the best way to move forward with it is to continue using git and github to post our work and progress. I also investigated something called Dockers and setting one up. I think this has potential for snapshotting our progress at a particular point in time. It is better than cloning the github repo as well since you don't need to download decencies. Furthermore, if our code has local file paths being read, we can include those attached files within the docker file. I the best case for right now is to continue using git and potentially start utilizing a docker. Of course, our work is still in the Grafana cloud system so if people want to check that out, they can, although it is a bit confusing to work with.
