This week, I continued working on the Flask app that would take a user's input like CSV file and prediction length and test One Fits All with it. The issue that occurred is that I put this file in my One Fits All folder, which requires me to download certain requirements onto my computer. The last time I ran into this issue, I started working on UConn's HPC and was able to get all the package requirements onto my environment. I think once I get past this issue, I can continue to work on shaping the existing parsing and testing functions to fit any CSV file, not just the ones used in the OFA paper.
